

Hi All,

I want to modify the attributes in the element tag container and I successfully modify and save them. However, the position of the tag container that I modified always move up to the previous line.

For example:

old_file.xml:

```
<?xml version="1.0" encoding="utf-8" standalone="no" ?>
<name creator="me">
  <firstname>jonh</firstname>
</name>
```

after I go into the old_file and modify the attribute from creator = 'me' to 'you' and save to a new file, the content of the new file looks like this

new_file.xml:

```
<?xml version="1.0" encoding="utf-8" standalone="no" ?><name
creator="you">
  <firstname>jonh</firstname>
</name>
```

I want the structure to remain the same as the old_file and just have the creator attribute changes from "me" to "you".

this is how I did it.

```
; Get the xml file
doc = OBJ_NEW('IDLffXMLDOMDocument', FILENAME=old_file.xml)
docElement = doc->GetDocumentElement()

; Get the creator attribute
creatorText = docElement->GetAttributeNode('creator')
creatorText->SetValue, 'you'

; Save the input msdb to a new filepathname
doc->Save, FILENAME = 'new_file.xml'
```

Any helps is greatly appreciated.

Thanks
