
Subject: Plotting 2 functions w/ 2 axis on same plot

Hi all:

Can some IDL guru tell me what is the easiest way to plot
2 functions (that are not on the same order of magnitude) so that
the left axis belongs to one function, and the right axis belongs
to the other.

For instance, if function 1 goes from 0 to .5 and function 2 goes
from 0 to 300, and I want to overlay the two functions on one
plot like:

```
.5  300
.4  250
.   .
.   .
.   .
0 ----- 0
  X
```

Your help will be greatly appreciated!

Thanx,
Dawson
