Hi guys,

I'm migrating some ugly FORTRAN binary blobs used by some applications into shiny new NetCDF files, and I realize I've never worked with NetCDF in IDL before.

My first stop, as usual, was at Coyote, and it looks like the Coyote NetCDF object can be used to build whatever edifice I need.

But before I get to building, I wanted to inquire of the assembled: is there a NetCDF equivalent to Liam Gumley's fantastic SDS_READ program for HDF files?

If the answer is no, I may just be tempted to port that program to NetCDF, because I have become so used to it.

What would be absolutely fantastic is a file that vacuums up all the attributes and data in a NetCDF file and returns a structure with everything, but I don't think that could be done without lots of EXECUTE(), which makes the baby Cthulhu cry.
