Subject: IDL syntax highlighting for GeSHI
Posted by miamibrian on Thu, 21 Apr 2011 20:04:48 GMT

I wish IDL code would be sensibly highlighted in wikispaces.com web
pages,
which are an otherwise very nice tool for a programming course. They
use
GeSHI (Generic Syntax Highlighter). http://qbnz.com/highlighter/

GeSHI doesn't support IDL yet (only like 59 other languages!)

Someone would have to write a PhP thing.
It looks not-quite-easy.
http://qbnz.com/highlighter/geshi-doc.html#language-files

Emacs has an IDLwave mode that looks good. Or perhaps
whatever syntax recognition stuff is in IDLDE could be wrangled?
It's not something I can start from scratch. Any heroes out there?
