First I run:

```
dd if=inputfilename of=outputfilename ibs=4096 cbs=1024 conv=unblock
```

to unblock the ASCII (not binary) uncompress file.

Then the following IDL script works

```
cimage=intarr(1201,1201)  
filein='los_angeles-w.dem'
```

```
get_lun,unit1  
openr,unit1,filein  
mapname=' '  
DEM_level_code=0  
elevation_code=0  
reference_code=0  
zone_code=0  
map_project=dblarr(15)  
xy_unit_code=0  
z_unit_code=0  
poly_sides=0  
DEM_corners=dblarr(2,4)
```

```

elevation_range=dblarr(2)
reference_angle=0.d0
accuracy_code=0
spatial_resolution=fltarr(3)
num_rows=0
num_cols=0

aformat='(A144,4I6,15D24.15,3I6,4(2D24.15),3D24.15,I6,3E12.6 ,2I6)'
readf,unit1,format=aformat,mapname,DEM_level_code,elevation_code,$
    reference_code,zone_code,map_project,xy_unit_code,z_unit_code,$
    poly_sides,DEM_corners,elevation_range,reference_angle,accuracy_code,$
    spatial_resolution,num_rows,num_cols

;convert corners to degrees
DEM_corners=DEM_corners/3600.
line = {elevations, crow:0,ccol:0,nnodes:0,cnodes:0,clon:0.d0,clat:0.d0,$
        cdatum:0.d0,celvmin:0.d0,celvmax:0.d0,$
        celevations:intarr(1201)}
print,mapname
print,DEM_corners
i=0
.run
while (not eof(unit1)) do begin
readf,unit1,line
for j=0,1200 do cimage(j,i) = line.celevations(j)
i=i+1
endwhile
end
close,unit1
free_lun,unit1
cimage = transpose(cimage)

Thank you for creating that routine. I have been hoping for a way to shade_surf DEMs, but never explored it much. Ok here in an obvious question for you.

I downloaded a DEM called from USGS called:

mount_mckinley-w.gz

Then unpacked it using: gunzip mount_mckinley-w.gz

Resulting in the binary file: mt_mc_kinley-w

Can you tell me how to associate the contents of this file with the variable 'dem' to be used in your program??

Or have I done something wrong?

Thanks,
Chris
