
Subject: XLOADCT problem?

On three different VMS workstations (AXP & VAX), under several different combinations of versions of VMS, Motif, and IDL we consistently have problems with XLOADCT.

We get the following error every time we mouse-click on a color table name in the color table menu:

```
-- Procedure/function called with too many parameters: LOADCT.  
-- Execution halted at: XLOADCT_EVENT   121 @IDLlib:LIB(XLOADCT)  
--           WIDGET_EVENT  
--           XMANAGER       469 @IDLlib:LIB(XMANAGER)  
--           XLOADCT       479 @IDLlib:LIB(XLOADCT)  
--           $MAIN$
```

Is this a site-specific problem? VMS specific? Or is the routine fubar?
