I'm Aishwarya from India. I'm working on navigating the venus images using IDL. My images are in Fits format. My objective is to find latitude longitude in venus planetocentric coordinate system. Now, what I have is in image coordinates. I can find the Venus'North pole angle, sub observer latitude and longitude. But I do not know where to start and how to proceed to really navigate the image. I also have sub Earth latitude and longitude. Any suggestions would be greatly helpful.

Thank you in advance,  
Aishwarya.
