Subject: Unable to get error\exception from IDL wrapper

Hello,
Wondering if anyone else has seen same thing. I have a java swing
application that is calling into IDL via some wrappers that I have
written around some common code and IDL operations. I am testing the
ability to catch exceptions then try catch it in my java app. If I
execute the wrapper in IDL in the workbench the error is caught using
the catch technique and then I simply return the error code. If I try
and call this via java expecting the same error the IDL process simply
hangs and doesn't return. Every time a new test is started I start a
separate thread and inside that thread a separate IDL Process is
started. If I kill the IDL process task, then I get JIDLException. Why
am I not seeing this exception not being sent back up? Any ideas.....
Thanks
