
Subject: String formatting nightmare

Hi all,

I have this title text for a graph:

```
STRING FORMAT=('"t!Dcorner!N: ", I0, "s !4U!X!Dsat!N: ", I0, "deg Phase  
screen vel: ", F3.1, "m/s")', tcorner, phisat, vps)
```

and I need to replace the "deg" characters with the degree symbol:

```
STRING("232B")
```

Is there any way to include that inside the STRING FORMAT argument or
is the only way really to build the string in stages?

Thanks!
