
Subject: polar_cgContour?

I see many threads regarding polar contour filled plots, but none occurring after the release of the great Coyote GS. It would be of great help to know from David if something like polar_cgContour is in the pipeline, or cgContour should be used instead after a coordinate transformation from Cartesian into z, r, theta. Or is the use of MAP_SET still the best option? The goal is to be able to use a whole colortable (255 colors) to contour a 2d-array between preset min/max value, and having a matching colorbar.

Thanks,
m
