I'm wondering whether there is an easy way to position axis title (I'm
setting the titles using the axis command). Every now and then a title
is either too high or too low and this can generally be fixed by
adding a carriage return to the string !C. But there are times when a
carriage return moves the title by too much, especially when the font
size is large. This can be solved by using the !A and !B commands
(http://idlastro.gsfc.nasa.gov/idl_html_help/
Embedded_Formatting_Commands.html), but this does not work properly if
subscripts or superscripts are in the title. In cases where my axis
title contains subscripts or superscripts, what is the best way to
shift the title location by say, 1/2 the font height.

Thanks, Tim
