Folks,

OK, my TICKNAME crash problem has been solved! Thanks everyone for your help.

The problem, thank God!, was not with either the Coyote or Catalyst directory on my path. I had one other directory on my path, which I call CoyotePlus. It is a directory where I put small utility programs I use, other people's programs I use, etc.

The problem turned out to be (you might have guessed this with IDL 8, although I didn't) a name conflict problem. I think you are going to be surprised when you discover the name. The name of the conflicting function is tex2idl.

I just thought you might want to know. :-)

Cheers,

David
