Has anybody else seen this problem? If so is there any known explanation
for it?

Running IDL3.6.1c on a Sparc 5 with Solaris 2.4.

I have an application that includes an exclusive menu with bitmap label
buttons (created with XMENU) and also (elsewhere on the main menu) two
buttons which invoke the PICKFILE routine. When the PICKFILE menu is
generated, the bitmap labelled buttons lose their labels and just retain
the diamond exclusive button state indicators. When the PICKFILE is
destroyed then they recover!

Is this a general problem with modal widgets or a PICKFILE specific thing
(All the other new windows that appear from this utility use a DIY
management to facilitate passing and retrieving values.
