Hi guys.
I wrote a program that run, is not perfect but at least run :) .
I would like to distibute it in my working group in a way that even
the no-IDL-owner could run it.
I did a distribution with the veryveryvery usefull michael galloy
program for multi platform distribution.
Until now everything fine...
but then at the first VM run... CRASH! aaarrggh: I run out of memory!
I did several times, on different machine, with different parameters
the result is the same:
from the IDE is ok from the VM no!

So i suspected for some memory limitation of the VM but i did not
found trace of it in any of the IDL documentation neither in the
forum.
The program crash around the 2 GB.

I'working in win7 or winserver2008

Any clue?
any help?

Could it be that you're using a 64-bit IDE, but a 32-bit VM?

Greg

 At the end that was THE problem.
I was quite sure to have checked the VM used, but indeed not!

Thanks for pointing it out!!

Kr.
