If anyone out there is running IDL for Windows on a Pentium system under either Windows 3.1 or Windows NT, I'd be much obliged if they'd run TIME_TEST and mail me the results. I'm looking at upgrading to a P120-based PC, and possibly WinNT, and would like to know what kind of performance I might expect from IDL in this configuration. I know the topic was discussed a few months ago, but the faster Pentiums are just now available, so I thought it worth revisiting the question.

Thanks to all in advance. I'll summarize the results for the net.

Dave
