Hi folks,

I have a strange problem. I have borrowed a license for 30 days using the LMTools and all seems to work fine when I start the IDL normally (with the exe file). But when I ran the IDL over a Java/IDL bridge I always get a license error. When I'm connected directly to the license server the bridge works just fine.

Is there something else I should do for the bridge to work? Also, can someone tell me how to change one of our floating licenses to a fix one? We would need a fix license on the processing server once all the infrastructure is set up? So far we did not get an answer on the matter from our local idl provider.

Thanks for the answers,  
Matej

I just found out that batch mode still searches for the license to the server.
