Hello,

I have run into this 'known problem' that twm crashes when you move the pointer is moved over a widget window. It is described in the IDL_DIR/notes/twm.doc which claims that a fix is available at boulder.colorado.edu:/pub/idl/fixed_r4_twm.tar.Z. However, this is (no longer?) true.

The IDL version is 3.6.1a (sunos sparc).

Does anybody know where this fix has gone to? I did an archie search but that returned nothing. Is there another solution?

Please send me EMAIL (garrelt@astro.su.se) since I won't be reading news until I have found a local server (this is going through the server at my former workplace).

Cheers,

Garrelt Mellema
