I wrote a few minutes ago:

> I have a problem I don't understand. I have a program that runs on two different Windows 7
machines, both running IDL 7.1.2. If I make a save file of the program and run it on the IDL Virtual
Machine on my office computer, the program runs like a champ. If I use the same files I used on
the first machine (the only difference is the location of data files for my program and my IDL
directory structure) to create a save file on my work machine, and I run that on the IDL Virtual
Machine, it complains about not having a function named READ_TIFF.
>
> Now, of course, READ_TIFF is a built-in IDL function that is loaded at run-time via a DLL. If I
search for a READ_TIFF with File_Which, I don't find one, as I expect.
>
> Why am I not picking up READ_TIFF as a compiled (or built-in) function in the second
instance? I have triple-checked that I am doing a RESOLVE_ALL in the code that creates the
save file.

If I run this same file in an IDL 8 Virtual Machine, I have no problems whatsoever. Is something
screwed up with this IDL 7 Virtual Machine?

Cheers,

David
