
Subject: FILE_SEARCH in IDL

Hi,

I am trying to use the FILE_SEARCH function in IDL to look for certain files by passing multiple string identifiers combined with the * wildcard.

eg. FILE_SEARCH('*{block, latitude, radiation}*',/FOLD_CASE)

It is for some reason only searching for the first string in the { } but I want it to perform a search using all the strings in the list.

I guess I am making some syntax error but have not been able to figure it out.

Any help will be really appreciated
