Hello

I was trying to average the components of 100 months data. Each month file has 1895 floating array data.

I read the data into IDL using For loop

I have two parameters, L and Clm. L ranges from 0 to 60. I want to have the average of the 100 months Clm at L=0,1,2,----60 (meaning at L= 0, the average will be like ((Clm @L=0, month1)+(Clm@L=0,month2)-----+(Clm@L=0,month100))/100. Can any one help me,suggesting how i can handle it.

Thanks in advance

Guta
