Is there a particular data format necessary to make a kml file in ENVI that actually works in Google Earth/Moon? I've had mixed results with different data sets using SPEAR under tools. Each time a .kml file is created, but some work some don't. It leaves me wondering I need a certain variable format for the input.

Josh

Ok, so does anyone know of an ENVI group that might be able to help me?

Thanks,  
Josh

I've had some success using the SPEAR Google Earth bridge as long as the image has been georeferenced from a GLT first.
