IDLdoc 3.5 is ready!

See the IDLdoc project site for the download link:

<http://idldoc.idldev.com/wiki/Downloads>

Here are the release notes:

- * Added list of inherited properties to class descriptions.
- * Provides workaround for possible bug in IDL where list object contains strange variables that report as the type code for object, but are not actually objects (they are pointers).
- * Fixed bug where Categories page showed private or hidden items.
- * Added hide/show prompts in code snippets in HTML output from rst markup comments.
- * Allow markup in Uses tag when using the rst markup parser. Note: the Uses tag is for a list of files or routines optionally separated by commas, plain text will have commas inserted between words.
- * Fixed errors in LaTeX output.

Like I said in a post about the beta for this release, I think the hide/show prompts in code snippets is really handy:
