Hi,I'm Marta from Italy!

Please,someone can help me?

I've got an ascii file with lots of rows and columns, I must select 2 columns,x and y,plot them and set max and min value to exclude bad data points.

Here is what I've made(it works,but I don't know if it's the best way to do it):

```
data=read_ascii("")  
x=data.field01[6,*]  
y=data.field01[14,*]  
plot,x,y,max_value=40,min_value=0
```

the problem is: max_value and min_value gives extremes to pick up data only for y variable...how can I do to set also max_value and min_value for x???

THANK YOU!!!!!!
