> Hi guys, I need to rotate the text of the categorical axes of a bar graph 270 to make the text vertical (otherwise the text overlaps and I cannot read anything). Any idea how to do it with cgBarPlot?

To do this, you will have to alter the cgBarPlot code to suppress the labeling of the axis. Then add your own axis labels with cgText. You can see how this is done by looking at the code in cgDCBar, where this is done with discrete color bars. Getting the spacing right as you rotate the text is the fun part of this programming exercise. :-)

Cheers,

David

ufff.. de fun part of the exercise make me think that maybe is better to make the plot in excel!

Thanks David!

Marta
