Examine the structure output of fstat(-1)

e.g.

```
idl> print,(stat(-1)).isagui
```

 will be true for the DE but not for a terminal

> Why I ask is: If a routine is launched from within the DE I would like it to display some info via a gui and if it were launched via a terminal then I would like the information printed out at the terminal. An example would be a progress bar. From the DE a nice gui progress bar shown and from the terminal just a textual output of percent complete.

That should be

```
idl> print,(fstat(-1)).isagui
```
