Hi,

I have a $A(254 \times 254)$ matrix and $B(0:254)$. I want to get the value of X . However when I give `determ(A)` in idl I get zero. Which perhaps means that A is singular and its inverse cannot be found.

I have checked for duplicate rows and columns in A they have been removed.

How do I solve this system? Given that

From the problem that I am solving, I know A can be over determined but not under determined.
Gompie.
