You can always try something along the lines of

```
IDL> ind = WHERE(FINITE(alt), count)
IDL> PLOTS, temp[ind], alt[ind], PSMY=-2
```

This assumes the NaN's occur in the same place in each array, of course.

Cheers,
Phillip

Phillip,

Thank you very much. Took some playing around to get it to work but this is exactly what I needed. I've never used the finite command before or PLOTS much.

Sincerely,
Morgan
