---

Good morning everyone,  
while using IDL I get this message:

<Error>: The function `CGSFlushWindow' is obsolete and will be removed in an upcoming update. Unfortunately, this application, or a library it uses, is using this obsolete function, and is thereby contributing to an overall degradation of system performance. Please use `CGSFlushWindowContentRegion' instead.

I guess this is related to something more general than IDL, it may be related to something wrong in my update from Snow Leopard to Mountain Lion... I found some posts on the web but nothing really helpful. Anyone came across it? Solution?  
Thanks in advance.
