
Subject: Pass variables into Newton or BROYDEN for solving non-linear equations

I have a non-linear equation system to solve every loop step. In each loop step I have to pass 4 variables, which are different in each loop, into the non-linear system. I have been working on this for an hour and it seems BROYDEN does not allow to pass variables in the equations, and it's also not possible to add another 4 equations in the system. I kind of stuck here.
