Folks
hi,
I have a question: i did a classification with ENVI, and there is something that i could not figure
out:
Imagine we have an area with:1-water,2-soil, 3-forest, and i did 3 ROI for those parts and then i
proceed to classification smoothly. When we have selected these 3 area with 8 bits image (DN
0-255) how does classifier knows to draw the lines for classification? what we have selected in
ROI?
Thanks for any help in advance,
cheers,
Dave
