
Subject: Printing color?

Has anyone had any luck printing color (particularly from a color HP Deskjet) from the edit->print menu in IDL 4.0 for Windows? BW is fine, but when I try to print color, it only prints a portion of the picture (not even a third), and then the printer stops responding. No clue.

I tried to print directly with `print_file` and using `spawn`, but `print_file` didn't work at all, and printing a `.pcl` from the DOS prompt was SLOW (I mean over five minutes for it to even start printing!!). I'm at a loss.

If anyone's had similar experiences or knows what to do, please let me know. My e-mail address is below. Thanks.
