---

Hi, someone have used conv\_doit before ?

Is about a missing variable.

I tried to use the CONV\_DOIT following the manual:

```
ENVI_DOIT, 'CONV_DOIT',          $  
    DIMS = dims,                 $  
    KX = 5, KY = 5,              $  
    FID=fid_in,                 $  
    METHOD=2,                   $  
    OUT_BNAME='convolution',    $  
    OUT_NAME=strOut,            $  
    POS=[0],                     $  
    R_FID=fid_out
```

The process start and then before ending a message from envi appears:

conv\_doit: An error has occurred during processing

Error: "Variable is undefined: SPEC\_NAMES." The result may be invalid.

I do not know which spec lib path to pass to the routine, since the page manual about conv\_doit does not have info about this keyword.
