Subject: Where does catalyst call the catEventDispatcher?

Recently when I try to learn the event management process of catalyst objects, I found that all the event from the objects will be explained by catEventDispatcher. In the function code file, it said that:

This routine is called by the IDL system, not by a user.

So I can't find any place where the function had been called. But when I debug my catalyst based application, the function involved the all the event process! Very strange!

Can anyone help me ? Please.

Thanks.

Finally, I found it's calling in the catalyst code.

Thanks.

I'm sorry. This is the Secret That Cannot Be Revealed!

Cheers,

David
