
Subject: Unequally spaced ticklabels with the FSC_COLORBAR function

Hi,

I have found an issue with the FSC_COLORBAR function.

I wondered why the ticklabels were not distributed equally in the given range in my example (the line with the "levels" variable is taken from "fsc_colorbar__define.pro"):

```
IDL> minval = 46.8614502
IDL> maxval = 46.8615112
IDL> divisions = 10
IDL> levels = minval >
(INDGEN(divisions+1)*(maxval-minval)/divisions+minval) < maxval
IDL> pm, levels, FORMAT='(F0.6)'
46.861450
46.861458
46.861462
46.861469
46.861473
46.861481
46.861488
46.861492
46.861500
46.861504
46.861511
```

The reason is that when I call the function with "divisions" being an integer the above result occurs. A change to a DOUBLE value yields the correct result:

```
IDL> divisions = 10d0
IDL> levels = minval >
(INDGEN(divisions+1)*(maxval-minval)/divisions+minval) < maxval
IDL> pm, levels, FORMAT='(F0.6)'
46.861450
46.861456
46.861462
46.861469
46.861475
46.861481
46.861487
46.861493
46.861499
46.861505
```

46.861511

IDL>

David, if you are reading this, please consider a floating point variable for the division by the variable "divisions".

Regards

Karlo

Karlo, if you are reading this, please update your Coyote Library to something that is less than 10 years old! :-)

```
minval = 46.8614502
maxval = 46.8615112
cgcolorbar, range=[minval, maxval], divisions=10d, format='(F0.6)'
```

You can find the Library here:

http://www.idlcoyote.com/programs/zip_files/coyotelib.zip

Cheers,

David

Hehe, nice joke. Actually I downloaded your library yesterday just to make sure that I _have_ the latest version. ;)
Anyway, if I understand your humorous hint correctly I should use "cgcolorbar".
A quick check showed me that

cgcolorbar, range=[minval, maxval], divisions=10

and

cgcolorbar, range=[minval, maxval], divisions=10d

yield the same results.

Thanks for your reply!

Regards

Karlo
