Hi,

Is there a simple way to write outputs to a string variable that has the same result as by using the 'print' statement ?

I'm asking something like 'sprintf' as to 'printf' in C.

Thanks.

Gary

Use the string() function:

```
IDL> a = !pi
IDL> b = 'This is PI: ' + string(a)
IDL> print, b
This is PI: 3.14159
```

Note that the string function takes a "format" keyword, just like print:

```
IDL> print, string(!pi, format='(f10.2)')
3.14
```
