
Subject: what to do with core files generated by idl

Hi all,
Since it's my first post here, I'd like to thank you all for your usefult tips in this "compgroup" place !
My IDL program produces a core file, after a "segmentation fault" caused, I guess, by too many
'PS' files generated by my program.
Is there something I can do with it?
Thank you!

Yes, you can delete the core files. [*]
CM

[*] - core files are only useful for internal debugging (using 'gdb' for example), but IDL does not
provide metadata which would allow debugging.

If this is reproducible then you may want to file a bug report with Exelisvis support.
