I am using IDLnetURL to download data. I have setup the callback function to update a status bar with progress information. However, whenever an error occurs in the callback function, any attempt at a Get thereafter results in one of the the following errors:

% IDLNETURL::GET: CCurlException: Error: Http Get Request Failed. Error = easy handled already used in multi handle, Curl Error Code = 2

% IDLNETURL::GET: CCurlException: Error: Http Get Request Failed. Error = , Curl Error Code = 2..

and I have to exit IDL in order for the error to stop appearing (-> CloseConnections does not resolve the issue). Code = 2 indicates some problem while initializing CCurl. Is there a way to fix this like, say, in a CATCH block?

Well, I cannot seem to create a simple program that will reproduce the error. I have subsequently fixed the error in the callback function, so I guess I can ignore this until I screw things up again...
