Hi

I have six images and I want to plot all of them on the same window. I use the tvscl command but I want to replace it by !P.Multi. I tried the following

```
!P.Multi=[0,3,2]
cgImage, 1
cgImage, 2
cgImage, 3
cgImage, 4
cgImage, 5
cgImage, 6
!P.Multi=0
```

I notices that the images shrinking and look "fat". Can anyone help with this?

Regards,
G

I have no idea what a "fat" image looks like, but you will find options galore for laying out images in cgLayout.

Cheers,

David

Do you mean the aspect ratio is incorrect? If so, you'll probably want to keep the aspect ratio the same using the appropriate cgImage keyword.
