Hi there,

I'm hoping someone can enlighten me about cubic spline fitting. I have a dataset of y vs x, but I want to get a finer resolution dataset at xx indexes:

```
x = [0.5372973, 0.5382103, 0.5392305, 0.5402197, 0.5412042, 0.54221, 0.543209,$  
0.5442277, 0.5442277, 0.5452125, 0.546217, 0.5472153, 0.5482086,$  
0.5492241, 0.5502117, 0.5512249, 0.5522136, 0.5532056, 0.5532056,$  
0.5542281, 0.5552039, 0.5562125, 0.5567836]
```

```
y = [0.01, 0.03108, 0.08981, 0.18362, 0.32167, 0.50941, 0.72415, 0.90698,$

```

```
yvals = spline(x, y, xx)
```

This code gives me -NaN values, but I am not understanding why. Is my dataset too sparse for cubic spline interpolation?

Any help is greatly appreciated. Thank you for reading!

It's because you have a couple of repeated x values: 0.5442277 and 0.5532056.

Thank you so much for your very keen observation! Removing the duplicate values worked!
