
Subject: Inter Process Communication with IDL

We're building a system, where IDL is used as visualization server. Therefore we must be able to send visualization requests to IDL. The problem we have, is that the system should run on Windows as well as on Unix. I figured that the best way to communicate with Windows would be DDE but that's not available with Unix. And RPC is not available with Windows.

What is the best way to communicate that is available with Windows as well as with Unix? Any experiences?

Thanx

Thomas
