hi

here is simple example code

```
win = window()
```

```
p1 = plot(/test, /current)
```

```
p2 = plot(/test, sym='D', name='temp', /over)
```

```
;lost p1 and p2 object.(is the object is correct?)
```

```
p1 = 0
```

```
p2 = 0
```

;but i can change the "p1" and "p2" property through "win" object.

```
win['plot'].thick=2
```

```
win['temp'].sym_color='red'
```

i think, the "p1" and "p2" properties saved in "win" object.

so, how can i get the "name" property of losted "p1" and "p2" object from "win" object??
