Hi

for example

```
win = window()
p = plot(/test, /current)
p = 0 ;; lost p
```

```
win_dim = win.dimensions
```

```
selected = win.hittest(floor(.5*win_dim[0]), floor(.5*win_dim[1]), $
    dimensions = win_dim)
print, selected
```

it`s cool.

but how about this example

```
win = window(/buffer)
p = plot(/test, /current)
p = 0 ;; lost p
```

```
win_dim = win.dimensions
```

```
selected = win.hittest(floor(.5*win_dim[0]), floor(.5*win_dim[1]), $
    dimensions = win_dim)
print, selected
```

the selected is <nullobject>

if using buffer keyword, how can i get information like first exmaple??

Thanks.
