Hi,

I am aware that image() function supports shapefiles too but have no clue on the syntax to be used for the same. Also, the same is the case with creating a polygon shapefile. Herewith I am in need of an example to create a polygon shapefile using IDLffshape with say one attribute and overlay the same on a raster using IMAGE(). I request the group to give me some inputs regarding the same. Thanks for patiently reading my post.

Regards,
Puneeth
