Hello all

I have filled my missing value with NAN

```
data = Array[4176, 168]
```

```
ntime= 168
```

I am interested in calculating covariance matrix

```
matrix = (1/ntime-1) * (Double(data) ## Transpose(data))
```

I found this result

```
result = Array[168, 168]
```

```
Min = NaN
```

```
Max = NaN
```

Any help would be appreciate on how to do the covariance matrix on the good data with exclusion of missing data

Best regards

Is it adequate to eliminate NaNs in your derived values rather than filter them prior to your calculation?

```
data = randomu(seed, 4176, 168)
data[randomu(seed, 336)*(4176*168L)] = !values.f_nan
matrix = (1/ntime - 1)*(Double(data) ## Transpose(data))
print, min(matrix)
      NaN
print, min(matrix, /nan)
-1410.1838
```
