Hello

I have been working with big data files (~18MB each)

And everytime I need to handle anything with the data, mostly plotting, takes a long time. So I was trying to put them all in one file per year (the data is arrange by date) But just running this takes a few hours.

```
PRO Save 1year
 GET_LUN, outlun
 Openw, outlun, 'name.txt'
 Year = "
 READ, Year, PROMPT='Enter Year:'
 openw, outlun, 'C:data\vear'+ Year+'.txt', /get lun
 files=FILE SEARCH('C:data'+Year+'*', COUNT=nfiles)
 Print, files
 data = []
 FOR i=0,nfiles-1 DO BEGIN
  filename=files[i]
  fileNumber = STRMID(filename,51,5)
  nlines = FILE_LINES(files[i])
  thisFile = files[i]
  ;line=fltarr(17,1)
  OpenR, inLun, thisFile, /Get Lun
  SKIP LUN, inLun, 1, /LINES
  while not EOF(inlun) do begin & $
   line=make_array(17,1, type=5)
  Readf, inLun, line, FORMAT='...'
  data=[[data],[line]]
 Endwhile
 Free Lun, inLun
ENDFOR
PrintF, outLun, data, FORMAT= '...'
END
```

I was wondering if there is an easier way to handle this data, I don't know anything about SAVE files, may be this is easier?
Please help

Thank you

```

Hi,

I think that this line is responsible for making things slow:

```
data=[[data],[line]]
```

If the array data gets to be lon, then it will take a long time to copy the previous data to a new variable and add one element...

```
You have two options:
1) only valid for IDL version >8.0. Use a list(). before the for use:
data = list()
then instead of data=[[data],[line]] use:
data->add. line
Then at the end:
PrintF, outLun, data->toArray(), FORMAT= '...'
2) it's more complicated, but general. Create the data array loooong, then fill it up. You could also
actually guess it's length:
nData = 01
FOR i=0,nfiles-1 DO BEGIN
  nlines = FILE_LINES(files[i])
  nData += nlines-1 ;one line you always disregard
ENDFOR
Now create data so that it is long enough:
myDataStructure = make array(17,1, type=5)
```

and in the cycle you fill up. You will also need a "fill-up" counter:

```
fillCounter = 0I
FOR...
while...
data[fillCounter] = line
fillCounter++
endwhile
...
endfor
```

data = replicate(myDataStructure, nData)

I hope it helps...

Cheers, Helder

Hello Helder

Thank you for your help, I am implementing the first option you suggested. I am having trouble now because one of the columns is calendar format and I am getting this error PRINTF: Value of Julian date is out of allowed range

:(is there an easy way to solve this, or should I just keep date info in different colums?

HEre is what the data look like and my format:

```
2014-12-01T00:00:12.905
C(CYI, X,CMOI02, X,CDI02,X, CHI02,X, CMI02, X, CSF0)
I am using the same fomat in both reading and writing the data
is this correct?
```

Now I wanted to ask something else. I have a bunch of columns that I don't really need, is there a way to create a save file just with the date column and the one that I care? (I am guessing this is the easiest version of files to save big data because they are binary)

Thanks again

-Luz Maria

Hi.

sorry, but I don't know much about dates and Julian in particular. You should either wait for somebody else to answer or repost with new subject.

I don't understand your second question what you mean by "just with the date column and the one that I care". Could you make an example, be more specific?

cheers, Helder

Hi again,

I worked agrunf the date issue, and now I have year in one column, month in other column, etc.

Also I re did my data with only the number I care about

newline=[line(1),line(2),line(3),line(4),line(5),line(6),line(10),line(19),line(20),line(21)]

So now this is how the data looks like

[year, month, day, hour, min, secs, data1, data2, data3, data4]

2003.00 1 1 0.0 0.0 44.2630 19.7620 0.173730 8.0 0.0

But I have another issue now...

When I do

PrintF, outLun, Newdata->toArray(), FORMAT='(...)' I only get the first column onto my array (this is what the file shows):

I solve it!
I need /TRANSPOSE keyword in the toArray()
