Dear GDL users and contributors

We are very happy to inform you about the delivery of GDL 0.9.6 !

<http://sourceforge.net/projects/gnudatalanguage/>

The major progress in this version is related to the Widgets support.

e.g. ATV and StarFinder work well ...

Main message

http://sourceforge.net/p/gnudatalanguage/mailman/message/347_38009/

Now a MSwin port is ready:

http://sourceforge.net/p/gnudatalanguage/mailman/message/347_38478/

To have more frequent informations, please consider subscribing to

<https://lists.sourceforge.net/lists/listinfo/gnudatalanguage-devel>

Don't hesitate to test this new version and report any trouble

onto the SourceForge tracker (the best way) or to me.

Please notice that we welcome code contributions but

we need they come with a license compatible with GNU GPL v2 or later.

with best regards

Alain C.

PS: a script to easily download and compile a limited subset of GDL

(without Eigen3 and without WxWdiget) on a very broad number of OS

(GNU/Linux, Unix, *BSD, OSX, MSwin) is available, see in "Main message"
