Hello all,

How can I use awk command inside idl? I am doing:

```
spawn, "awk '{print $1 }' data2.dat >tmp1"
```

It is showing no error in IDL prompt but the file tmp1 is not getting created. My data2.dat is not empty. Any help in this regard???

Use the result and error_result output params to see what is happening:

```
IDL> spawn, "awk '{print $1 }' data2.dat >tmp1", result, error_result
```

```
IDL> print, result
```

```
IDL> print, error_result
```

```
IDL> spawn, "awk '{print $2 }' data2.dat >tmp1", result, error_result
```

IDL> print,result

IDL>

This is not working as well, basically I am interested in tmp1 file to be created inside IDL with column 1 of data2.dat. But with this no tmp1 is getting created.
Any other suggestion please???

What about error_result? That is the one we want to see.

IDL> spawn, "awk '{print \$2 }' data2.dat >tmp1", result, error_result

IDL> print,error_result

IDL>

i.e it is not printing anything

You say data2.dat is not empty, but does it have any lines with the second field that \$2 refers to? Do you get any tmp1 file if you execute the awk command directly at the shell prompt?

Hmmm, I guess if there are no second fields the file should still be created but with empty lines.

data2.dat is having 6 column so there is no issue of an empty field. However still tpm2 should be created .

But is it, if you do not involve IDL?
