I've accumulated a list of variable length arrays, e.g.

IDL> diam

```
[  
  [0.13860799, 0.035755500, 0.037822500],  
  [0.17081800],  
  [0.28975499, 0.050387200, 0.053300999],  
  [2.6970799, 1.3410200, 0.60130101],  
  [0.64086902, 0.61904001, 0.66626000, 0.27435899],  
  [0.86649197, 0.71003902],  
  [0.83967102, 0.47101700],  
  [0.18503401],
```

...

Is there a nice way to flatten this into a 1D array?

cheers,

Greg

<http://www.harrisgeospatial.com/docs/LIST.html#ToArrayMethod>

?

I was curious as to how this works (never used the ToArray method):

```
IDL> l = LIST(Findgen(3), Findgen(12), Findgen(5))
IDL> l
[
  [0.0000000, 1.0000000, 2.0000000],
  [0.0000000, 1.0000000, 2.0000000, 3.0000000, 4.0000000, 5.0000000,
   6.0000000, 7.0000000, 8.0000000, 9.0000000, 10.000000, 11.000000],
  [0.0000000, 1.0000000, 2.0000000, 3.0000000, 4.0000000]
]
IDL> help, l.toarray()
% LIST::TOARRAY: Unable to concatenate arrays: Element 1
% Execution halted at: $MAIN$
```

Nup. How about the DIMENSION keyword?

```
IDL> help, l.toarray(dimension=1)
<Expression>  FLOAT    = Array[20]
```

Huh. Cool.

Thanks, Paul - I should have seen that!
