Hi,

I am using this command in one of my bash script :

```
l=$(idl -quiet -e "print, n_elements('tmp1'))"
```

its showing error: Illegal variable name.

How ever same script is running on other system.

What could be the reason???

The way this is written, 'tmp1' is a scalar string, so N\_ELEMENTS should always return 1.

In any case, I think "Illegal variable name" is a bash error because IDL just says "syntax error" when using an invalid variable name:

```
IDL> print, n_elements(3days)
```

```
print, n_elements(3days)
```

```
      ^
```

```
% Syntax error.
```
