Hi

I recently upgrade ma machine with Ubuntu 16.04 and I had some difficulty to run my IDL8.2 licence on it. After several exchanges with IDL help desk I can run it but if I reboot the machine I have to follow a protocol to kill some processes, wait to open a port and run the Imgrd prog. I would like to know if there is a way to do that automatically ? Thanks

```
$ mkdir /usr/tmp/  
$ cd /usr/tmp  
$ touch .flexlm  
$ chmod 666 .flexlm
```

After that finalize Imgdr pendence:

```
$ killall Imgrd  
$ killall idl_Imgrd
```

Do it again after 30s to be sure that all executable were closed.

Then wait for a 1min, necessary for the system open ports 1700 and 1701, and then run:

```
$ /usr/local/exelis/idl82/bin/bin.linux.x86/Imgrd -c /usr/local/exelis/license/license.dat -l  
/usr/local/exelis/license/Imgrd.log &
```

/usr/local/exelis/license/lmgrd.log &
```

assuming you are not asking about a server, could you run it from
.bash_profile ?

add to ~~~~~ .bash_profile ~~~~~
readyIDL.sh &

```
~~~~~ file readyIDL.sh ~~~~~
#!/bin/bash
if ![-d /usr/tmp/ ]; then mkdir /usr/tmp/; fi
curDir=`pwd`
cd /usr/tmp/
touch .flexlm
chmod 666 .flexlm
killall lmgrd
killall idl_lmgrd
sleep 30
killall lmgrd
killall idl_lmgrd
sleep 60
/usr/local/exelis/idl82/bin/bin.linux.x86/lmgrd -c
/usr/local/exelis/license/license.dat -l
/usr/local/exelis/license/lmgrd.log &
cd $curDir
notify-send 'readyIDL' 'IDL should be ready to use now, if not debug
readyIDL.sh'
~~~~~
```

it might need some debugging, and I'm not a bash expert, but even if half
of it is wrong it might give you some ideas on how to proceed...

Good luck, Markus

Thanks a lot Markus. After a few tweaks, it is working like a charm ...
